## Commentary

The Spheria Australian Microcap Fund rose 3.7% for the month, outperforming the Benchmark which rose 2.6% by 1.1%.

The small cap index rose 2.6% over September, partially recovering the August falls. For the first time in what feels like a long time, the markets favoured value-style investments and sold off momentum and growth style names. This thematic was mirrored in all the major global equity indices suggesting that equity market correlations are high at the moment and that similar themes are likely to be driving them in unison. The key drivers appear to be a continued shift toward passive/ index investing, the rise of quantitative investing (that is investments driven by computer algorithms with minimal human portfolio management intervention) and a flow out of active and value-style investing. It is hardly a surprise that these themes have garnered widespread praise and support. They are working in the short term and the alternatives, in a global milieu of virtually zero interest rates, are not yielding investors attractive returns. On the other hand it is creating a multitude of distortions in the way capital should be allocated. What do we mean by this?

Capital flows via the market mechanism to seek the highest return – subject to various levels of risk assessment. Return on capital therefore has been the bedrock of capitalism and the flows of capital. Why are stocks like CSL, Realestate.com.au, Seek and Technology One such strong performers over the long run? Because they have consistently invested and reinvested capital in their business with high incremental returns on capital producing excess cashflows for investors and strong organic earnings growth. As global interest rates have effectively collapsed, in order to fix one social ill (namely keep unemployment low) they have unfortunately created another social ill – namely misallocation of capital. The consequence of super low rates for a super long period of time has been to push investor time horizons further and further out such that it has now broadly entered the realms of the speculative. In forecasting company earnings, we explicitly forecast out a time frame of 5 years (mid cycle year). We would admit that as the time horizon extends to the later part of this timeframe there is a reasonably large degree of uncertainty with our forecasts and thus we tend to forecast some conservatism into those numbers to ensure we have a fairly certain base case..

As markets have been pushed further into the future to seek (justify!) the valuations for a number of companies which currently lose money, the logic suggests that there is a greater and greater forecast error being implicitly accepted into the investment thesis. It doesn't take a genius to work out that accepting greater and greater risk by looking further into an uncertain future is unlikely (at least based on history) to produce a good outcome for investors. Nonetheless, this is effectively the bet that a lot of quant and passive strategies are currently making. It is why we think that a focus on reasonably forecastable cashflows combined with attractive valuations will prove to be a much better investment strategy for our clients. The part reversal of the momo for longer investment thematic over September seems to suggest most are not positioned for this kind of risk/ timeline re-assessment. There are other signs too that broader opinion might be re-assessing future prospects. The fall in valuation of Unicorns like WeWork (and its well-publicised IPO withdrawal). We visited Singapore recently and learned that unemployment is ticking up over there as a lot of the employment created by other Unicorns (start up businesses valued in excess of US\$1.0bn by the private markets) has gone sharply into reverse as they have retreated from the market.

## Major positive movers in the portfolio (September reporting period)

**Class Ltd (CL1.ASX)** increased 21% over the month after being heavily sold off on the back of their full year results. The company is currently undertaking some reinvestment in R&D and staff hires to reinvigorate revenue growth. In the meantime, customers remain incredibly loyal to the business with an eye watering retention rate at over 99%. We see upside based on a strong market position, great cash flow generation, a net cash balance sheet, undemanding valuation and potential for additional products.

**City Chic (CCX.ASX)** continued its recent strong run of performance rising 16%. CCX was named as a Stalking Horse bidder for the online assets of US plus sized retailer Avenue. Subsequently (in early October), CCX successfully bought Avenue's online business for US\$16.5m (A\$24m) subject to the approval of a US bankruptcy court. Avenue's online revenue in the US is around A\$100m, so assuming a modest 8-9% EBIT margin suggests they may have paid around 3-4x EBIT to materially expand their customer base and expand geographically.

**Michael Hill International (MHJ.ASX)** rose 20% over September as consumer sentiment gradually improved on the back of the housing cycle and newspapers ran an article suggesting a key competitor could potentially close. MHJ remains a reasonably asset heavy retailer (they need to keep a lot of fairly costly and low turnover stock) but trades on only 6x EBIT with very modest gearing. A change in management team should also see some improvement to the underlying as they implement an improved retail strategy.

## Major negative movers in the portfolio (September reporting period)

**Independence group (IGO.ASX; not owned)** rallied 20% on the back of an Indonesian export ban on unprocessed nickel ore which is likely to tighten global nickel supplies. Nickel prices rose 23% in August in anticipation of the Nickel ban and IGO caught up in September.

**BAL (not owned)** rose 73% over the month on the back of the earlier mentioned takeover offer.

**IIOF Holdings (IFL.ASX)** rose 30% over the month after announcing the sale of its 70% shareholding in Ord Minnett for \$115m and the Federal Court found for IOOF in the case brought against them by APRA.
